

Customer Testimonial

Problem

Large house with partial wireless coverage
Interference from many devices in the house

Solution

iPowerline can network up to 64 individual devices and can be used to strengthen wireless signal

Benefits

No cabling running all around house
No interference from neighbours' systems
No breakdown of signal

Type of Property

3-storey detached house with 4 bedrooms and 4 living areas

Nature of the Problem

"We are a bit of a gadget household and wanted to connect all of our digital equipment up. Our wireless system, which used to allow us to get internet in most (but not all) rooms in the house, couldn't cope with all the different devices and we were getting a lot of interference from the signals crossing over. This even affected the quality of the internet signal around the house."

Solution Implemented

As most digital devices have an Ethernet port, the iPowerline system connected all of them onto one network overcoming the 'signal interference' problem and providing the added benefit of having a central point for managing both the content and equipment.

"Now all of our music, movies and photographs are stored on a special drive attached to the computer and we can listen to music, watch movies and use the internet without having to restart the equipment every half hour or losing the signal or connection. It also works great with wireless so we can still use our laptops outside in the garden."

iPowerline is fantastic!"

Devices Connected

1 Desktop PC
1 Mac
2 Laptops

1 media server
3 room audio system
Nintendo Wii game
